GMT metcalf eddy wastewater engineering 5th pdf - A rotating biological contactor or RBC is a biological treatment process used in the treatment of wastewater following primary treatment. The primary treatment process means protection by removal of grit and sand and coarse material through a screening process, followed by a removal process of sediment by settling. The RBC process involves allowing the wastewater to come in contact with a ...

Rotating biological contactor - Wikipedia - Applications Pretreatment. Before the water enters the clarifier, coagulation and flocculation reagents, such as polyelectrolytes and ferric sulfate, can be added. These reagents cause finely suspended particles to clump together and form larger and denser particles, called flocs, that settle more quickly and stably.

Clarifier - Wikipedia - International Journal of Engineering Research and Applications (IJERA) is an open access online peer reviewed international journal that publishes research .. Peer Reviewed Journal - IJERA.com -
